

Lab #11

EGRE246

1. Write a C program that implements the binary search algorithm as presented in class. .
2. Test your program using a data file of positive unique integers named `lab11.dat`. You need to manually make this data file that contains less than 100 values and is terminated by -1. The items to be search can be randomly generated by a C `rand` function.
3. Implement a binary search tree (BST) module as presented in class and make a main function to test BST module. The majority of code for BST module can be found in the lecture slides, you need to complete all the code and make it work.
