

Lab #6

EGRE246

1. Add the following routines to your string data type from last week's lab:

```
int scmp(string s1, string s2);          // same as strcmp (from string.h)
string scat(string dest, string src);    // same as strcat (from string.h) but returns a
                                         // copy of dest
string sToUpper(string);                 // converts all lowercase letters in s
                                         // to upper case while just copying all
                                         // chars that aren't lower case
string sToLower(string);                 // does same but upper --> lower
```

You cannot use any of C's builtin routines for this lab, and you must include these routines as part of your module from last week's lab (i.e. you will need to modify `string.h`). See the online documentation (or write test programs) to determine the semantics of the C library functions `strcmp` and `strcat`. Note that both `sToUpper` and `sToLower` return new strings – do not modify the strings passed to these routines.
